

## Counter

1x Counter 24 V, 500 kHz, 32 Bit

- 32-bit counter
- Up to 500 kHz (4-fold evaluation)
- Accommodates 24 V incremental encoders and proximity sensors
- Filters: 10 kHz | 50 kHz | 100 kHz | 500 kHz
- All inputs can be inverted
- Limits for counter and measured readings
- Hysteresis for input
- Pulse duration for output
- Refresh rate / averaging time for measuring mode
- 8 bytes of input data (count and status)
- 8 bytes of output data (preset count and commands)

Counters are used to detect pulses that are faster than a controller's cycles, i.e., signals that the controller will be unable to detect properly and that therefore need to be pre-processed.

The counter module detects the edges of 24 V signals as pulses. The impulses can be counted or converted into a frequency, rotational speed, or period. The counter module features an additional 24 V input and a 24 V output for a direct response to start pulses and to quick system state changes.
